## SetaPDF-Encryptor API - Introduction

The SetaPDF-Encryptor API is a collection of PHP classes that allows PHP developers to encrypt PDF documents and to grant user rights to them.

## SetaPDF-Encryptor API - System Requirements

All SetaPDF APIs are written in pure PHP and does not need any other libraries installed except a PHP environment of a version later than 4.3 (until 2010) and an installed Zend Optimizer or installed Ioncube loader.

All releases since 2010 require PHP 5.

As shown in the next paragraph, it is also recommended to install MCrypt.

The SetaPDF APIs have their own integrated RC4 function for encrypting and decrypting the contents of a PDF file. For performance reasons, the APIs initially tries to use the MCrypt library, if that is installed. If MCrypt is available, the APIs require the arcfour algorithm.

The use of MCrypt increases the performance by up to 90% if encryption or decryption is needed.

If MCrypt is not available, the APIs automatically fall back to their internal RC4 function.

Depending on the file size of the PDF files to be processed, some adjustment to the php.ini directives `max_execution_time` and `memory_limit` are recommended.

For performance optimization, all SetaPDF APIs provides a caching system that prevents the unnecessary reparsing of PDF files.

To use the AES algorithm for encryption MCrypt is required!

Furthermore for AES encryption with a 256-bit key the API needs the `hash()`-function which is available since PHP 5.1.2 or through [PECL](#).

## SetaPDF-Encryptor API - Installation

The SetaPDF API collection includes a directory structure which should be kept, because of the internal usage of paths.

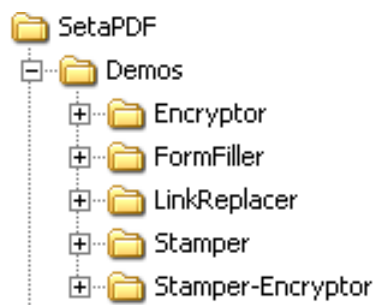

### *Files and directories*

All packages includes a root directory called *SetaPDF*. In this directory you'll find the desired API directories. The directory structure for all current available SetaPDF APIs looks like this:

If you transfer the files via FTP make sure you use binary mode.

For each API or API combination you'll find demo files in the /Demo directory in nearly the same structure:

To use one of the SetaPDF APIs in your applications you have to add the SetaPDF-directory to your `include_path`:

```
set_include_path(get_include_path() . PATH_SEPARATOR . 'PathTo/SetaPDF/');
```

Now you can simply include the SetaPDF-Encryptor API with the following line:

```
require_once("Encryptor/SetaPDF_Encryptor.php");
```

## SetaPDF-Encryptor API - Ioncube encoded package

If you own a package of the API, which is encoded with Ioncube you need a loader installed on your server. There are 2 ways to get ioncube encoded files to run:

1. Install the loader in your php.ini
2. Load the loader at runtime

For details how to install ioncube or simply to check if it is installed, just download the loaders from <http://www.ioncube.com/loaders.php>, extract its content to /SetaPDF/ioncube and open the file ioncube-loader-helper.php in the directory /SetaPDF/ioncube in your webbrowser and follow the instructions. For further instructions go to <http://www.ioncube.com/>

### Licensing with Ioncube

Each ioncubed package needs a valid license to run. The provided licensefiles for the SetaPDF API are named: **.htSetaPDF-<API-NAME>.icl**

You don't have to rename that file, because the package search for exactly that named file in one of its upper directories. All APIs first searches for this file in the their initial directory. F.g. The SetaPDF-Encryptor API searches first in /SetaPDF/Encryptor/. If the licensefile is not found it goes one directory upwards: /SetaPDF/ and so on...

Please notice that the filename is prefixed with .ht. Some systems hide such prefixed files automatically.

## SetaPDF-Encryptor API - Zend encoded package

If you own a package, which is encoded with the Zend Safeguard Suite you have to install the Zend Optimizer. For more information please go to [http://www.zend.com/products/zend\\_optimizer](http://www.zend.com/products/zend_optimizer).

### *Licensing with Zend*

Also the zend encoded packages need valid licenses to run. The provided licensefiles for the SetaPDF API are named:

**.htSetaPDF-<API-NAME>.z1**

Please notice that the filename is also prefixed with .ht. Some systems hide such prefixed files automatically.

For zend encoded packages the name of the license file can be changed and has no real meaning. You can load the licensefile dynamically on runtime in your php script ([zend\\_loader\\_install\\_license\(\)](#)) or by default in your [php.ini](#).

Zended packages are only available for development- and serverlicenses.

## Standard and Certificate-based encryption

Until version 1.6 of the SetaPDF-Encryptor API it was only possible to use the standard encryption with an owner- and userpassword.

As of the version 1.6 the API also supports certificate-based encryption. Certificate-based encryption lets you encrypt a document for specific recipients by means of public key technology. Various recipients can be given different permissions for the document.

## SetaPDF-Encryptor API - Examples of Use

### *40-bit Encryption*

This example encrypts a document with 40-bit, allowing the user to print the document and display it as an inline document. The user needs a user password to open the PDF file.

```
/**
 * set the includepath for SetaPDF APIs
 * You have to point to the root directory "SetaPDF"
 */
set_include_path(get_include_path() . PATH_SEPARATOR .
realpath(dirname(__FILE__) . '/../..../'));
// require the SetaPDF_Encryptor-class
require_once("Encryptor/SetaPDF_Encryptor.php");
// Create a new instance of SetaPDF_Encryptor and define the original document
$encryptor =& SetaPDF_Encryptor::factory("docs/License_Agreement_SetaPDF.pdf");
// grant the right "print"
$permissions = array(
    "print"
);
// Let's encrypt with 40bit and send it to the client!
$error = $encryptor->encrypt("newpdf.pdf", "myownerpw", "myuserpw", $permissions,
SETAPDF_ENC_RC4_40, "I");
// Errorhandling
if (SetaPDF::isError($error)) {
    echo "We've got an error: ";
    print_r($error);
    die();
}
```

### *128bit Encryption*

This example encrypts a document with 128bit, allowing the user to print the document in high quality and to extract/copy text and images. The user does not require a password to open the document. The encrypted file will be offered to the client for downloading. In addition, the document will also be streamed.

```
/**
 * set the includepath for SetaPDF APIs
 * You have to point to the root directory "SetaPDF"
 */
set_include_path(get_include_path() . PATH_SEPARATOR .
realpath(dirname(__FILE__) . '/../..../'));
// require the SetaPDF_Encryptor-class
```

```
require_once("Encryptor/SetaPDF_Encryptor.php");
// Create a new instance of SetaPDF_Encryptor and define the original document
$encryptor =& SetaPDF_Encryptor::factory("docs/License_Agreement_SetaPDF.pdf");
/**
 * grant rights for printing the document
 * in high quality and allow the user to copy/extract
 * text and graphics from the PDF.
 */
$permissions = array(
    "print",
    "copy",
    "degraded-print"
);
// Let's encrypt with 128bit without an userpassword and send it
// with an download-dialog and in streaming-mode to the client!
$encryptor->encrypt("newpdf.pdf","myownerpw", "", $permissions,
SETAPDF_ENC_RC4_128, "D", true);
```

### *128-bit AES Encryption + Caching function*

This example uses the caching function of the API.

```
/**
 * set the includepath for SetaPDF APIs
 * You have to point to the root directory "SetaPDF"
 */
set_include_path(get_include_path() . PATH_SEPARATOR .
realpath(dirname(__FILE__).'../../..'));
// require the SetaPDF_Encryptor-class
require_once("Encryptor/SetaPDF_Encryptor.php");
// define the cache-path
define('SetaPDF_ENCRYPTOR_CACHEPATH', realpath(dirname(__FILE__).'../cache/'));
// Create a new instance of SetaPDF_Encryptor and define the original document
$encryptor =& SetaPDF_Encryptor::factory("docs/License_Agreement_SetaPDF.pdf");
// enable Caching-System
$encryptor->setUseCache(true);
/**
 * grant rights for printing the
 * document in low quality
 */
$permissions = array(
    "print"
);
// Let's encrypt with AES 128-bit without an userpassword
```

```
// and send it to the client!  
$encryptor->encrypt("newpdf.pdf","myownerpw", "", $permissions,  
SETAPDF_ENC_AES_128, "I");
```

## SetaPDF-Encryptor API - Constants / Configuration

The API needs some constants which are hard coded into the API or have to be defined by you. There is also a constant that requires definition prior to first use.

Also you can define global variables which affects the behaviour of specific tasks.

### *Global Configuration Variables*

`$GLOBALS[ 'SETAPDF_PARSE_INVALID_FILES' ]` (boolean)

(DEPRECATED) If this global variable is set the pdf parser tries to read/repair invalid PDF documents. This setting could affect the processtime on huge files very much.

*This variable isn't used by the parser as of version 1.3 (all current version of the SetaPDF APIs)*

`$GLOBALS[ 'SETAPDF_SEARCH_FOR_XREF_OFFSET' ]` (integer)

With this global variable you can adjust the offset position from which the pdf parser should search for the pointer to the xref table. If not defined the default value of 1500 is used.

The pdf specification says it has to be in the last 1024 bytes of a file. But sometimes there are errorious document in the wild that have some garbage at the end so we need the possibility to do a kind of finetuning for them.

### *Predefined Version Constants*

The following constants defines the versions of specific files of the SetaPDF core:

`SETAPDF_CORE_VERSION` (string)1.3

Version of the abstract SetaPDF class. Defined in /SetaPDF/SetaPDF.php

`SETAPDF_PARSER_VERSION` (string)1.3

Version of the SetaPDF\_Parser class. Defined in /SetaPDF/SetaPDF\_parser.php

`SETAPDF_PDF_CONTEXT_VERSION` (string)1.3

Version of the pdf\_context class. Defined in /SetaPDF/pdf\_context.php

`SETAPDF_WRAPPER_FUNCTIONS_VERSION` (string)1.2.1

Version of the wrapper functions file. Defined in /SetaPDF/wrapper\_functions.php

### *Constants to define*

`SetaPDF_ENCRYPTOR_CACHEPATH` (string)

The constant `SetaPDF_ENCRYPTOR_CACHEPATH` has to contain a path to which the PHP process can

write and read. This constant **must** be set as soon as the caching system is activated. Otherwise the caching system will not be used.

As of version 1.5 a new global caching function exists and the API own functionality will be removed in coming version.

### *Predefined Constants*

**SETAPDF\_ENC\_RC4\_40** (integer)0

Standard encryption with 40-bits.

**SETAPDF\_ENC\_RC4\_128** (integer)1

Standard encryption with 128-bits.

**SETAPDF\_ENC\_AES\_128** (integer)2

AES (Advanced Encryption Standard) encryption with 128-bits.

**SETAPDF\_ENC\_AES\_256** (integer)3

AES (Advanced Encryption Standard) encryption with 256-bits.

### *Predefined Constants for Errorhandling*

Possible errorcodes for the SetaPDF main class starts at 1 and ends at 99.

**E\_SETAPDF\_CANNOT\_OPEN\_FILE** (integer)1

cannot open XXXX !

**E\_SETAPDF\_UNABLE\_TO\_POINT\_TO\_XREF\_TABLE** (integer)2

Unable to find pointer to xref table

**E\_SETAPDF\_UNABLE\_TO\_FIND\_XREF** (integer)3

Unable to find xref table - Maybe a Problem with 'auto\_detect\_line\_endings'

**E\_SETAPDF\_UNEXPECTED\_HEADER\_IN\_XREF\_TABLE** (integer)4

Unexpected header in xref table

**E\_SETAPDF\_UNEXPECTED\_DATA\_IN\_XREF\_TABLE** (integer)5

Unexpected data in xref table

**E\_SETAPDF\_FILE\_IS\_ENCRYPTED** (integer)6

File is encrypted!

`E_SETAPDF_WRONG_TYPE` (integer)7

Wrong Type of Element

`E_SETAPDF_UNABLE_TO_FIND_OBJECT` (integer)8

Unable to find object at expected location

`E_SETAPDF_ENC_UNSUPPORTED_FILTER` (integer)9

`E_SETAPDF_ENC_UNSUPPORTED_ALGO` (integer)10

`E_SETAPDF_ENC_UNSUPPORTED_REVISION` (integer)11

`E_SETAPDF_ENC_NO_RIGHTS_FOR_SPECIFIC_ACTION` (integer)12

`E_SETAPDF_ENC_WRONG_OWNER_PW` (integer)13

`E_SETAPDF_CANNOT_COPY_FILE` (integer)14

Cannot copy file XXXX to YYYY

`E_SETAPDF_HEADER_ALREADY_SEND` (integer)15

Some data has already been output to browser, can't send PDF file

`E_SETAPDF_UNABLE_TO_FIND_TRAILER` (integer)16

Trailer keyword not found after xref table

`E_SETAPDF_UNSUPPORTED_FILTER` (integer)17

An unsupported compression filter is required.

`E_SETAPDF_ZLIB_REQUIRED` (integer)18

To handle /FlateDecode filter, php with zlib support is needed.

`E_SETAPDF_DECOMPRESSION_ERROR` (integer)19

Error while decompressing stream.

`E_SETAPDF_UNABLE_TO_CREATE_CACHE_DIR` (integer)20

Unable to create directories in cache directory.

### *API Related Predefined Constants for Errorhandling*

Possible errorcodes for the SetaPDF-Encryptor API starts at 300 and ends at 399.

`E_SETAPDF_ENC_ERR_PERM` (integer)300

Error description: Incorrect permission

**E\_SETAPDF\_ENC\_ERR\_PERM\_40BIT** (integer)301

Error description: Incorrect permission for 40bit

**E\_SETAPDF\_ENC\_ERR\_CACHEUPDATE\_NOT\_POSSIBLE** (integer)302

Error description: A Cache Update is only possible when *\$this->usecache* is true.

**E\_SETAPDF\_ENC\_ERR\_MCRYPT\_NOT\_AVAILABLE** (integer)303

AES encryption requires mcrypt to be installed.

**E\_SETAPDF\_ENC\_ERR\_MCRYPT\_RIJNDAEL\_128\_NOT\_AVAILABLE** (integer)304

Needed cipher (RIJNDAEL\_128) not available.

**E\_SETAPDF\_ENC\_TMPDIR\_DOES\_NOT\_EXISTS** (integer)306

Fallback temporary directory `_tmp/` does not exists.

**E\_SETAPDF\_ENC\_DIR\_DOES\_NOT\_EXISTS** (integer)307

Directory "%s" does not exists.

**E\_SETAPDF\_ENC\_OPENSSL\_ERROR** (integer)308

An OpenSSL error occurs + all results from `openssl_error_string()`

**E\_SETAPDF\_ENC\_OPENSSL\_BOUNDARY\_ID\_NOT\_FOUND** (integer)309

Cannot find boundary id in smime message.

**E\_SETAPDF\_ENC\_OPENSSL\_ENC\_EXTRACTION** (integer)310

Error while extracting the encrypted content of the smime message.

**E\_SETAPDF\_ENC\_PKSEC\_NOT\_POSSIBLE** (integer)311

Public-Key Security is not supported for RC4 40bit encryption.

**E\_SETAPDF\_ENC\_OPENSSL\_NOT\_AVAILABLE** (integer)312

This module requires php compiled with openssl.

### *Constans for Cache Mechanism*

The following constants are used to control the behaviour of the caching mechanism of the pdf parser.

**SETAPDF\_P\_CACHE\_NO** (integer)0x00

Don't read and write cache.

**SETAPDF\_P\_CACHE\_READ\_XREF** (integer)0x01

Try to read the cached xref table.

```
SETAPDF_P_CACHE_WRITE_XREF (integer)0x02
```

Write the xref table to cache.

```
SETAPDF_P_CACHE_XREF (integer)0x01 | 0x02
```

Try to read and write the xref table.

```
SETAPDF_P_CACHE_READ_OBJECTS (integer)0x04
```

Try to read cached objects.

```
SETAPDF_P_CACHE_WRITE_OBJECTS (integer)0x08
```

Write read objects to cache.

```
SETAPDF_P_CACHE_OBJECTS (integer)0x04 | 0x08
```

Try to read and write objects to cache.

```
SETAPDF_P_CACHE_ALL (integer)0x01 | 0x02 | 0x04 | 0x08
```

Read and write objects and xref-tables.

## SetaPDF-Encryptor API - Caching

PDF parsing and handling can be an expensive task in view of needed cpu-power.

To avoid doing default tasks for a single document a few times the parser class offers a caching mechanism to reduce the overhead and avoid reparsing of PDF documents a few times.

The parser simply saves serialized data in the filesystem and load them back if needed. This data can be used with ANY SetaPDF API. So if for example the [SetaPDF-Merger API](#) creates the cache data, the [SetaPDF-Stamper API](#) can benefit from them.

As of this, the handling of the cache mechanism is done through static methods of the [SetaPDF\\_Parser class](#). Calls to this methods will change [static variables](#) in their method contexts, so that changes doesn't depend on the object instance but applies to all instances of a parser object. (We used static variable because of compatibility to PHP4)

There are 2 parts that the parser can cache:

### *1. The Xref Table*

This is a kind of table of contents of a PDF document. It includes information about all objects in a document and their byte-offset positions in the document. Often documents include several hundreds or thousands of entries in that table. Further more a PDF document can include more than one xref table, which relays on several updates of a document (incremental updates). But at least all tables have to be processed to get the final state of the document... By caching that data, the parser don't have to reparse the xref table out of the document.

### *2. Objects*

Each entry in the above described xref table points to an object representing specific data, like Images, Fonts, Pages,... If the parser should read such an object it have to go to the desired byte-offset position in the document, known from the xref-table, and have to parse the object token-wise. This process needs several string comparisons and also runs recursive until the object is totally read.

The parser can cache the read objects and use the cached versions at the next situation when it is needed. No byte-position change or parsing of any string is done but simply unserializing the data from the cached data.

### *Usage*

As already written the handling of the cache functionality is done by static methods of the [SetaPDF\\_Parser class](#).

You can use the static method right after including a desired API like the [SetaPDF-Merger API](#):

```
require_once( 'Merger/SetaPDF_Merger.php' );  
// at this point you can access the SetaPDF_Parser class
```

First of all you have to tell the API where you would like to save the cached data. You have to use the [SetaPDF\\_Parser::cacheDir\(\)](#)-method for this:

```
SetaPDF_Parser::cacheDir(realpath('../..'/path/for/cached/data/'));
```

Now you were able to activate the caching by calling the [SetaPDF\\_Parser::cacheFlags\(\)](#)-method with special flags. The flags are predefined in [Constants](#):

```
// Will read and write all data (xref table and objects) from/to cache.
SetaPDF_Parser::cacheFlags(SETAPDF_P_CACHE_ALL);
// Will just read and write the xref table from/to cache.
SetaPDF_Parser::cacheFlags(SETAPDF_P_CACHE_XREF);
// Will just read and write objects from/to cache.
SetaPDF_Parser::cacheFlags(SETAPDF_P_CACHE_OBJECTS);
```

After this the cache is active for all instances of any SetaPDF API.

Furthermore you can do some finetuning:

### Build the cache slowly

If you want the cache to be build piecemeal you can use the [SetaPDF\\_Parser::cacheNoOfObjectsPerInstance\(\)](#)-method to define a maximum of objects to cache in a single script instance. With this method you can avoid performance peaks because the cache writing process, for sure, also needs cpu time.

```
// cache a maximum of 100 objects per script instance
SetaPDF_Parser::cacheNoOfObjectsPerInstance(100);
```

### How is a file identified and how you can control it

By default the cache mechanism uses the [md5\\_file\(\)](#)-function to get an unique file identifier of the document. This file identifier is used as the directoryname in the [cache output directory](#). To give you the possibility to use another method for the fileidentification you can define your own function/method, which will be called when a fileidentifier is needed, with the [SetaPDF\\_Parser::cacheHashFunction\(\)](#)-method.

An Example: You already have your documents arranged in a database. This data have already unique ids related to the documents local path in your filesystem. As the ids are already known and are unique you should use the ids as a fileidentifier to avoid creating a hash with [md5\\_file\(\)](#).

Furthermore it is easier for you to manage the cache data, as you can for example delete the cache data if the data in the database table were deleted or changed.

The passed argument is of the pseudo-type [callback](#) and will be used with [call\\_user\\_func\(\)](#)-function.

```
function mapFilenameToId($filename) {
    // just pseudo code
    $db = YourDbClass::getInstance();
```

```
$id = $db->getOne("SELECT id FROM documents WHERE filename =  
".$db->quote($filename));  
return $id;  
}  
SetaPDF_Parser::cacheHashFunction('mapFilenameToId');
```

## SetaPDF - Class

This class is the base class for nearly all SetaPDF APIs. It offers some public static helper methods.

### *Class Overview*

SetaPDF

### *Child Classes*

▶ [SetaPDF\\_Encryptor](#)

### *Methods*

▶ [SetaPDF::isError\(\)](#)

## SetaPDF::isError()

### *Description*

```
SetaPDF {  
    boolean isError ( mixed $obj )  
}
```

Determines if a variable is a SetaPDF\_Error object.

### *Parameters*

#### ***\$obj***

Variable to check

### *Return Values*

*True* if *\$obj* is a SetaPDF\_Error object

## SetaPDF\_Error - Class

This class represents an error object thrown by a SetaPDF API. You can get more information about the error by checking the following properties `$obj->message` and `$obj->code`.

You can add your own error handling by defining your own class named `SetaPDF_Error` before you include any SetaPDF-File. The original class looks like this:

```
class SetaPDF_Error {
    var $message;
    var $code;

    function SetaPDF_Error($message = 'unknown error', $code = null,
                           $mode = null, $options = null, $userinfo = null) {
        $this->message = $message;
        $this->code = $code;
    }
}
```

## SetaPDF\_Parser - Class

The SetaPDF\_Parser class is the base class for all individual SetaPDF parser classes. It is for example responsible for reading the xref table or objects of a document.

The SetaPDF\_Parser class is an abstract class and *just* offers some static methods which let you control the cache functionality.

### *Class Overview*

SetaPDF\_Parser

### *Methods*

- ◆ [SetaPDF\\_Parser::cacheDir\(\)](#)
- ◆ [SetaPDF\\_Parser::cacheFlags\(\)](#)
- ◆ [SetaPDF\\_Parser::cacheMkdirMode\(\)](#)
- ◆ [SetaPDF\\_Parser::cacheNoOfObjectsPerInstance\(\)](#)
- ◆ [SetaPDF\\_Parser::cacheHashFunction\(\)](#)

## SetaPDF\_Parser::cacheDir()

### *Description*

```
SetaPDF_Parser {  
    mixed cacheDir ( [string $dir=null] )  
}
```

Sets the directory for cache data.

This method should be called static.

### *Parameters*

#### *\$dir*

Path to the directory where to write the cache data. If *null* the directory will not be changed.

### *Return Values*

The actual path.

## SetaPDF\_Parser::cacheFlags()

### Description

```
SetaPDF_Parser {  
    mixed cacheFlags ( [string $flags=null] )  
}
```

Sets the flags how the parser should handle read and write processes of objects or xref-tables.

This method should be called static.

You can use this flags to do fine tuning of the caching mechanism. The flags can be combined using a bitwise AND (&) operation.

If any flag is set, except `SETAPDF_P_CACHE_NO`, a valid writeable path should be set with [SetaPDF\\_Parser::cacheDir\(\)](#).

### Parameters

#### *\$flags*

The parameter defines the caching behaviour of the API. Available values are:

- ▶ `SETAPDF_P_CACHE_NO` - Don't read and write cache.
- ▶ `SETAPDF_P_CACHE_READ_XREF` - Try to read the cached xref table.
- ▶ `SETAPDF_P_CACHE_WRITE_XREF` - Write the xref table to cache.
- ▶ `SETAPDF_P_CACHE_XREF` - Try to read and write the xref table.
- ▶ `SETAPDF_P_CACHE_READ_OBJECTS` - Try to read cached objects.
- ▶ `SETAPDF_P_CACHE_WRITE_OBJECTS` - Write read objects to cache.
- ▶ `SETAPDF_P_CACHE_OBJECTS` - Try to read and write objects to cache.
- ▶ `SETAPDF_P_CACHE_ALL` - Read and write objects and xref-tables.

### Return Value [\(see also Constants / Configurations\)](#)

The actual value.

## SetaPDF\_Parser::cacheMkdirMode()

### *Description*

```
SetaPDF_Parser {  
    mixed cacheMkdirMode ( [integer $mode=null] )  
}
```

As the caching mechanism creates directories for each pdf document the API internally uses mkdir to create the directory. With this method you can define if and which parameter should be passed as the \$mode parameter of the [mkdir](#)-function.

This method should be called static.

### *Parameters*

#### ***\$mode***

The file mode.

The parameter consists of three octal number components specifying access restrictions for the owner, the user group in which the owner is in, and to everybody else in this order. More informations about the mode-parameter can be found [here](#).

### *Return Values*

The actual value.

## SetaPDF\_Parser::cacheNoOfObjectsPerInstance()

### *Description*

```
SetaPDF_Parser {  
    mixed cacheNoOfObjectsPerInstance ( [integer $no=null] )  
}
```

For sure a caching process needs more process power as the cached data have to be written to the file system. Often a PDF document is build with more hundres or thousands of objects which can increase the process time to a bad value.

With this method you can define how many maximum objects should be cached per script instance. So you can chop the cache creation over several script executions.

This method should be called static.

If you set the \$no-parameter, for example, to 100, the parser will cache 100 objects per script instance maximum, until all objects are cached.

By default the parser will cache ALL objects.

### *Parameters*

#### **\$no**

The maximum number of objects to cache per instance.

### *Return Values*

The actual value.

## SetaPDF\_Parser::cacheHashFunction()

### Description

```
SetaPDF_Parser {  
    mixed cacheHashFunction ( [callback $hashFunction=null] )  
}
```

To identify a pdf document the API uses the [md5\\_file\(\)](#)-function by default.

If you want to create your own identification process or if you already know a hash or unique property of the document you can use this method to define an own function/method which will be called when the parser needs the hash.

This hash/value will be used as the directory name in the cache directory (see [SetaPDF\\_Parser::cacheDir\(\)](#)).

The given value will be used as the function parameter of a [call\\_user\\_func\(\)](#)-call.

This method should be called static.

### Parameters

#### *\$hashFunction*

The function to be called.  
(See also informations about the [callback](#) type.)

### Return Values

The actual value.

### SetaPDF-Encryptor - Main class

This is the main class of the SetaPDF-Encryptor API.

#### *Class Overview*

#### *Methods*

- ◆ [SetaPDF\\_Encryptor::factory\(\)](#)
- ◆ [SetaPDF\\_Encryptor::setTmpDirectory\(\)](#)
- ◆ [SetaPDF\\_Encryptor::createNewTmpFileName\(\)](#)
- ◆ [SetaPDF\\_Encryptor::cleanTmpDirectory\(\)](#)
- ◆ [SetaPDF\\_Encryptor::setUseCache\(\)](#)
- ◆ [SetaPDF\\_Encryptor::encrypt\(\)](#)
- ◆ [SetaPDF\\_Encryptor::updateCache\(\)](#)

#### *Inherited Methods*

**Class:** [SetaPDF](#)

- ◆ [SetaPDF::isError\(\)](#)

## SetaPDF\_Encryptor::factory()

### *Description*

```
SetaPDF_Encryptor extends SetaPDF {  
    mixed factory ( string $sourcefile[, string $tmpDirectory=null] )  
}
```

This method has to be called static and will return an instance of the SetaPDF\_Encryptor class or an SetaPDF\_Error object.

### *Parameters*

#### ***\$sourcefile***

A string that defines the path (relative or absolute) to the original document. Only local paths are allowed.

#### ***\$tmpDirectory***

A path for temporary files. If not or *null* is passed the default fallback directory SetaPDF/Encryptor/\_tmp/ is used.

This parameter only affects the usage if you're going to use Public Key Security.

### *Return Values*

In case of success you get a new instance of the SetaPDF\_Encryptor class.

On failure an SetaPDF\_Error object will be returned. It is strongly recommended to check this return value with SetaPDF::isError().

### *Version*

The \$tmpDirectory-parameter is available since version 1.6

## SetaPDF\_Encryptor::setTmpDirectory()

### *Description*

```
SetaPDF_Encryptor extends SetaPDF {  
    mixed setTmpDirectory ( [string $tmpDirectory=null] )  
}
```

If you want to change the path for temporary files at runtime, you can use this method.

A writeable temporary path is only needed if you use Public Key Security.

### *Parameters*

#### *\$tmpDirectory*

A path for temporary files. If not or *null* is passed the default fallback directory SetaPDF/Encryptor/\_tmp/ is used.

### *Return Values*

*True* is everything works as expected or an SetaPDF\_Error object if an error occurs.

### *Version*

Available as of version 1.6

## SetaPDF\_Encryptor::createNewTmpFileName()

### *Description*

```
SetaPDF_Encryptor extends SetaPDF {  
    string createNewTmpFileName ( void )  
}
```

This method is a kind of helper method which is used to create unique filenames in the [temporary directory](#).

You can use this method to create temporary files which will be included in the [cleanTmpDirectory](#) routine of the SetaPDF-Encryptor API.

### *Return value*

An absolute unique filename/path

### *Version*

Available as of version 1.6

## SetaPDF\_Encryptor::cleanTmpDirectory()

### *Description*

```
SetaPDF_Encryptor extends SetaPDF {  
    boolean cleanTmpDirectory ( void )  
}
```

This methods deletes olded files in the temporary directory.

If the API causes an error it could be that temporary files will remain in the given temporary directory.

In the PHP 5 version this method is called automatically by the `__destruct()`-method.

In PHP 4 you can call it your own or register it as a shutdown function:

```
register_shutdown_function(array(&$encryptorInstance,'cleanTmpDirectory'));
```

The method makes use of the `glob()`-function. If this function is disabled cause of any security reason you can define your own function by setting it in the `SetaPDF::$globFunctionName` property. An example of a replacement function can be found in the user contributed notes on [php.net](http://php.net)

By default temporary files which are older than 60 seconds will be deleted. To adjust this value, change the `SetaPDF::$tmpFilesLifetime` property.

Temporary files are only needed if you use the Public Key Security feature.

### *Return value*

*True* if files were deleted. *False* if no file was deleted.

### *Version*

Available as of version 1.6

## SetaPDF\_Encryptor::setUseCache()

As of version 1.5 a new global caching function exists and the API own functionality will be removed in coming version.

### *Description*

```
SetaPDF_Encryptor extends SetaPDF {  
    void setUseCache ( [boolean $usecache=false] )  
}
```

**(DEPRECATED)** Is used to change the status of the caching function. Please note that the constant `SetaPDF_ENCRYPTOR_CACHEPATH` already needs to have been defined and contain a valid path to your file system, to which the Apache / PHP process can write and read. For more information on the caching function, please turn to the section on caching.

### *Parameters*

#### ***\$usecache***

*True or false* – turns the API caching function on (true) or off (false).

## SetaPDF\_Encryptor::encrypt()

### Description

```
SetaPDF_Encryptor extends SetaPDF {
    mixed encrypt ( string $targetfile[, string $owner_pass|$pks=null[,
        string $user_pass='', $permissions=array()[, integer
        $encryption_strength=SETAPDF_ENC_RC4_40[, $dest='F'[,
        $stream=false]]]] )
}
```

This method is the main component of the API. It is used to encrypt the documents.

### Parameters

#### *\$targetfile*

A valid path and filename for the new document if the *dest*-parameter is set to "F". Otherwise the name of the new PDF document.

#### *\$owner\_pass/\$pks*

This parameter can be used in 2 ways:

##### 1. Standard Security

The owner password. If you want to use standard security.

If it is set to *NULL*, the API will, for security reasons, generate a random password.

The password string has to be in PDFDocEncoding (which is similar to cp1252) if *\$encryption\_strength* is **NOT** set to SETAPDF\_ENC\_AES\_256. If *\$encryption\_strength* is set to SETAPDF\_ENC\_AES\_256 the password string has to be in UTF-8.

##### 2. Public Key Security

An array holding recipient certificates and individual permissions.

Each entry defines a set of certificates and individual permissions:

*certs*: Either a lone X.509 certificate, or an array of X.509 certificates. ([Details](#))

*permissions* (optional): an array identical to the *\$permissions*-parameter. If not set the permissions of the *\$permissions*-parameter are set.

*owner* (optional): A boolean value. When set to true permits the change of encryption and enables all other permissions for the recipients in *certs*.

Public Key Security is only available if the *\$encryption\_strength*-parameter is set to

SETAPDF\_ENC\_RC4\_128, SETAPDF\_ENC\_AES\_128 or SETAPDF\_ENC\_AES\_256

### *\$user\_pass*

The user password. If a user password is set, it will be asked for when opening the processed document in a viewer.

The password string has to be in PDFDocEncoding (which is similar to cp1252) if \$encryption\_strength is **NOT** set to SETAPDF\_ENC\_AES\_256. If \$encryption\_strength is set to SETAPDF\_ENC\_AES\_256 the password string has to be in UTF-8.

Has no meaning when using Public Key Security.

### *\$permissions*

This parameter defines the user privileges for a user opening or viewing the document. Each privilege has to be entered in the permissions array. Depending on the encryption strength, the following entries are possible:

Privileges for 40bit encryption (standard):

#### **print**

The user is allowed to print the document. If the key length is 128bit or greater the print quality is defined by the "degraded-print" flag.

#### **modify**

The user is allowed to modify the contents of the document by operations other than those controlled by "annot-forms", "fill-in" ( $\geq 128$ bit) and "assemble" ( $\geq 128$ bit).

#### **copy**

40bit: The user is allowed to copy or otherwise extract text and graphics from the document, including extracting text and graphics (in support of accessibility to disabled users or for other purposes).

128bit: The user is allowed to copy or otherwise extract text and graphics from the document by operations other than those controlled by "screenreaders".

#### **annot-forms**

The user is allowed to add or modify text annotations, fill in interactive form fields, and, if "modify" is also set, create or modify interactive form fields (including signature fields).

More privileges for 128/256bit encryption:

#### **fill-in**

The user is allowed to fill in existing interactive form fields (including signature fields), even if

"annot-forms" is not set.

### **screenreaders**

The user is allowed to extract text and graphics (in support of accessibility to disabled users or for other purposes).

### **assemble**

The user is allowed to assemble the document (insert, rotate, or delete pages and create bookmarks or thumbnail images), even if "modify" is not set.

### **degraded-print**

The user is allowed to print the document in a form that is equivalent to a true copy of the original PDF. When this is not set (and "print" is set), printing is limited to a lesser quality (Print As Image).

## ***\$encryption\_strength***

Expects an integer or [predefined constant](#).

`SETAPDF_ENC_RC4_40 = 0` - The document will be encrypted with the standard algorithm with a 40-bit encryption key.

`SETAPDF_ENC_RC4_128 = 1` - The document will be encrypted with the standard algorithm with a 128-bit encryption key.

`SETAPDF_ENC_AES_128 = 2` - The document will be encrypted with the AES algorithm with a 128-bit encryption key.

`SETAPDF_ENC_AES_256 = 3` - The document will be encrypted with the AES algorithm with a 256-bit encryption key. (Available since PDF 1.7 / Acrobat >=9)

## ***\$dest***

Defines how the encrypted document is handled:

- ▶ "F" saves the file to the file system
- ▶ "D" the file will be send to the client with a download dialogue
- ▶ "I" the file will be displayed in the client's browser window.

## ***\$stream***

This parameter is only used if `dest` is set to "D" or "I". If it is set to `true`, the document will be sent immediately as soon as the first content bytes are available. In this case the length-header will not be sent. If this parameter is set to `false`, the whole document is held in memory until it is completely assembled.

The streaming facility is very effective, because the client does not become aware of any script processing time.

### *Return Values*

*True* - if everything works as expected - an SetaPDF\_Error object if an error occurs.

### *Version*

Public Key Security is available since version 1.6

## SetaPDF\_Encryptor::updateCache()

### *Description*

```
SetaPDF_Encryptor extends SetaPDF {  
    mixed updateCache ( void )  
}
```

**(DEPRECATED)** This method creates a cache file for the PDF file sent to the [factory](#) method. It can be used to create the cache file beforehand or to update the cached version manually.

The call of this method presupposes that [setUseCache\(true\)](#) is activated prior to this method call.

### *Return Values*

*True* - if everything works as expected - an SetaPDF\_Error object if an error occurs.

## Caching (DEPRECATED)

As of version 1.5 a new global caching function exists and the API own functionality will be removed in coming version.

The SetaPDF-Encryptor API provides a special caching function that saves a serialized version of the parser object in your file system. Depending on the size of the document, this can save considerable processing time.

### *Documentsize <> Filesize*

Unfortunately it is not possible to predefine the cached data of a PDF document in its relation to its document size. The cache function only provides an intermediate storage for information, but not for embedded images or fonts.

Because of this, it is possible that the cache function will not be able to speed the processing of a 3 MB PDF document which includes some very large images. If the 3 MB document contains many pages, but only of text, the caching function will definitely reduce the processing time.

### *Usage*

You can use the caching function simply by defining a writeable path in the constant `SetaPDF_ENCRYPTOR_CACHEPATH` and activating `setUseCache()` afterwards. If such as path has not been defined, the caching function is ignored.
